IMPROVING EFFICIENCY AND SPEED IN VERIFICATION OF RECOGNITION RESULTS

ABSTRACT

A method for increasing efficiency of interaction by
an operator with data on a computer display includes
presenting the data to the operator on the computer
display, and providing multiple instances of an on-screen
control at different locations on the display for
selection by the operator using a pointing device linked
to the display. The control is actuated responsive to
the selection by the operator of any of the instances of
the control on the display.
